There are approximately 500 species of the genus *Aloe* of which 160 are indigenous to South Africa. Many of these are used in traditional healing. 'Aloe' is the generic name for the solid residue obtained from the latex of *Aloe ferox*, its tropical cousin, *A. vera* (barbadense). *A. ferox*, also known as *Aloe* of Cape aloe, is similar to *A. vera* but has many times more tannin and medicinal value. The latex, stored in specialized cells in the margins of the leaves between the thick epidermis, is rarely used for its antiparasitic activity. It should be administered by convection in liquid doses, for limited periods, due to its side effects and habituating potential. It is distinct from *Aloe* gel, the clear, jelly-like substance obtained from the soft cells in the inner leaf, which is an oral remedy for alleviating constipation. For soothing and treating ulcers of the digestive tract, modulating immune function and treating hair, oil can channels. It was first used clinically in the 1850s for the treatment of radiation burns. Today *Aloe* is a better recognized used in cosmetics and the cosmetic industry.

Aloe is a family (chlorophylls) like product in the isomer, a chlorophyll
